ABSTRACT

3 The present invention relates to a pharmaceutical composition of a biologically active
4 agent and a block copolymer composed of a poly(ethylene oxide) forming hydrophilic
5 segment and a poly(butyl (alkyl)acrylate-co-(alkyl)acrylic acid) that is capable of forming
6 supramolecular assemblies or micelles under favourable conditions. The supramolecular
7 assemblies or micelles formed from said polymers associate or dissociate reversibly upon
8 changes in the environmental pH. The pharmaceutical compositions of the present
9 invention contain hydrophobic drugs, cations or polycationic compounds, which can be
10 delivered to the body by oral route or other routes of administration.
